

Joint News Release

B2Gold Corp. and Radius Gold Inc. Reports on Positive Exploration Drill Results from the Trebol Project in Nicaragua

Highlights include hole TR-11-047 Containing 13.08 Grams per Tonne Gold over 7.00 Metres

Vancouver, May 17, 2011 – B2Gold Corp. (TSX: BTO, OTCQX: BGLPF) (“B2Gold” or the “Company”) and Radius Gold Inc. (TSX-V: RDU) (“Radius Gold”), are pleased to announce positive assay results from the initial 2011 exploration drilling program at the Trebol Project in Nicaragua. B2Gold has the right to earn a 60% interest from joint venture partner Radius Gold.

The over 3,000 metre diamond drilling program has been focused on three zones of low sulfidation gold occurrences in altered volcanic rocks covering a strike length of over five kilometres (“km”). These results confirm the Trebol Property’s potential to host, at or near surface, shallow dipping gold mineralization that could potentially be mined with very low strip ratios.

Mineralization throughout the Trebol area is characterized by shallow to moderately dipping tabular shaped vein and hydrothermal breccia zones within andesite. Outcropping horizons of the siliceous material have yielded impressive gold values in the trenching (*see B2Gold press release dated November 15, 2010*) and the drilling has shown that many of these zones extend up to 100 metres down dip and show continuity over distances of several hundreds of metres of strike length. Due to the shallow dips associated with the gold mineralization, most of mineralization is near surface and mostly oxidized.

The three zones, drilled to date are Cerro Domingo, the Paola Zone, and the Trebol North Zone. Drill holes contain up to 13.08 grams per tonne (“g/t”) gold over 7.00 metres in hole TR-11-047. Drilling by Radius Gold in 2008 first located the Cerro Domingo Zone and this has been confirmed and expanded in the recent drilling. The 2011 drilling campaign cut mineralization in the Cerro Domingo, Paola and Trebol North Zones with drill holes containing up to 1.96 g/t gold over 28.55 metres in hole TR-11-014 in the Cerro Domingo Zone, up to 8.86 g/t gold over 7.75 metres in hole TR-11-028 in the Paola Zone and up to 13.08 g/t gold over 7.00 metres in hole TR-11-047 in the Trebol North Zone. Drill intervals are highlighted below.

B2Gold Drill Holes

Zone	Drill Hole	From (metres)	To (metres)	Interval (metres)	Gold (g/t)	Gold (g/t capped at 25 g/t)
Cerro Domingo	TR-11-011	3.40	11.27	7.87	3.14	2.25
	including	5.45	5.85	0.40	42.38	25.00

The 2011 drill campaign at Trebol has successfully identified several areas that will require additional drilling to define the extent of the mineralization. The mineralization remains open to the north and south and in the covered areas between the three zones. In addition, the Company's geologists continue to

discover more low sulfidation epithermal gold, outcrop and float occurrences within the concession that contain plus 1.00 g/t gold assays in grab and chip samples over 11.5 km of the 22 km total strike length of the trend. In addition, a parallel zone has been located three km east of Cerro Domingo where preliminary grab sampling of similar siliceous material has yielded values up to 3.00 g/t gold.

Exploration is ongoing at Trebol and will continue as B2Gold geologists compile the recent drill data and plan the next round of trenching and drilling.

Samples for Trebol are submitted with blanks and industry certified standards inserted in the field and prior to reception at Inspectorate's prep lab in Managua. Pulps are then analyzed at Inspectorate's labs in Reno, Nevada. Check assays are currently being selected now that the drilling program has been completed and will be sent to ALS labs in Vancouver, Canada. Except where noted, all results stated in this announcement have passed B2Gold's quality assurance and quality control ("QA/QC") protocols.

The exploration programs for the Company are reviewed and the results approved by Tom Garagan, B2Gold's Qualified Person under National Instrument 43-101.
